Collecting and submitting samples

Location

Take the following steps into consideration when collecting leaf samples:

- Avoid the outer rows of the field and the first and last 10 yards of a row.
- Sample leaves of average leaf quality.
- Sample abnormal plants (with deficiency symptoms) separately. If a deficiency might be present in the young or old leaves of the total crop, sample these leaves separately as a young or old leaf sample.
- Keep in mind the sunny and shady side of the plant. Always consistently sample the same side.

Time of sampling

It is strongly recommended to take the samples before 9:00 AM. The plant will then have enough leaf-tension with proper moisture conditions.

Start sampling at early flowering and continue monthly until harvest, or sample by crop stage:

- Start sampling at shoot growth or one month before early flowering
- Early flowering
- Early fruit set
- Pre-harvest (Envero)

After harvest (Correcting for the new season)

Plant parts

Take the first fully developed leaves on the latest flush of branches. Sample from different spots in the orchard and use representative trees. Sample no more than 4 leaves per tree, make sure to sample at different points around the tree. Take the oldest vital leaves of the same branch

Remove the petioles to avoid that these will affect the sample. The petioles can have a significant effect on the analysis of the leaf samples.

Old leaf

Young leaf

It is prohibited to send in samples that have a fungal, bacterial or virus infection. The leaves must also be free from insects.

Sample size

For an average, representative sample about 100-150 leaves are needed, at least 300 grams. Sample size can vary, depending on leaf type (size and thickness). The dryer the shoots are, the more leaves are needed to reach the required amount of sap. If you have questions about sample size, please contact us.

Packing the leaf samples

When leaves are wet on the outside due to dew or rain, they can be dried with a tissue. Leaves have to be dry from the outside to be analyzed because water will have an influence on the results. Moreover, the leaves will spoil faster if there is water in the sample bag.

Please pack the young and old leaf samples separately, these will be two different samples. Carefully pack the leaves in a plastic zip-lock bag. Make sure all air is out, so leaf evaporation can no longer take place. See pictures.

Fill in the labels correctly and place them on the bags (see pictures below). We prefer pre-printed labels because it saves us a lot of administration time. It has also advantages for you:

- When using Bemesting-Online program you need the same location names and crop names to make comparisons (graphs), pre-printed labels make this a lot easier;
- If our employees must read what is on the label, the chance of reading errors is very high, this is not the case with preprinted labels;
- You no longer must write the location and crop name on the label on the spot. Let us know if you need help with this.

Sending the samples

The sample zip-lock bags with barcode can be sent in an envelope (make sure it fits in a mailbox (max 3,5 cm tall)). In case you want to send more than one sample, please send them together in 1 box, so they will arrive together. Then put sufficient postage on the envelope or package. Always check the weight. Please take care that envelopes are sealed well. You can put extra tape over the closure to avoid opening during transportation.

We recommend to sample crops on Friday and send the same day by DHL or FedEx, then NovaCropControl is receiving your samples in the beginning of the next week. Please put €1.00 as the shipment value on the sample package.

Do you ship samples from outside Europe? To avoid clearance delay at the customs please consult our shipment guide for sending samples to Europe. You can find this guide at our website.

Please send samples to the address below:
